I know what you're going to say: "no way, JPEG is the quintessential image format." Well, that's true if you insist that you can only ever work with photos as JPEG files because they are the only ones you've been advised to use and who all come from JPEG, JPEG, JPEG! But did you ever ask yourself why, exactly? For this, you may settle for reading this article . Lightroom 6 is the first release of Lightroom to feature a "Remix" view for finished projects. This is a new way to browse the photos in a project. You can open them in a new tab and work on them rather than in yet another Lightroom window. The "Remix" view was announced at Adobe Max and was previewed in Adobe Photoshop CS6 by way of the Layer panel. The new panel features two useful-looking features: the ability to choose a "Newest" or "Oldest" class of photos and to limit viewing of photos in various ways, such as by the date and time the photo was taken, location, and so forth. The latter is just a useful way to see at-a-glance what an image was shot at what time of year or month. The first look at this feature is exciting, because it shows real promise – I can't wait to see the rest of the details that are expected. The new layout also allows for access to the File-Export Curves and Lens Correction dialogs directly from the panel. The panel can also be toggled on and off at will. Layouts and the "shortcut" keyboard shortcuts were improved as well. The file-opening dialogs work the way they should. Editing in Photoshop still always remains easy to do and requires a simple click combination. Preferences are easy to navigate. No need to venture into the program's option menu for updates. There was a tutorial, but I found it a little bit too basic for me. I'd rather get a little more information and then have a chance to practice anything I've learned. I found myself still using the top slider most of the time, but I guess that's the way it always has been.
